

Cable trays inside the heat exchange station

Overview

Well-chosen cable trays do three things reliably: Carry a load without deformation. Let heat escape instead of trapping it. In a thermal power plant, cables run for kilometres. They cross boiler platforms, disappear into trenches, re-emerge near turbines, and finally end up in control rooms that never sleep. A rung spacing of 6 to 9 inches (150 to 230 mm) is preferable when the cable tray is intended for instrumentation and control applications that require. Do you wonder if poor airflow in your cable trays could be causing problems?

Many modern buildings rely on cable trays to carry a lot of power and data lines. But with more and more cables and longer use, cables getting too hot is a big issue. The mechanical and electrical characteristics, tests, certifications, overall quality management, recommendations mentioned in this technical guide only apply to our own cable management ranges and cannot under any circumstances be transposed to similar or. Cable tray for power plant installations is a vital topic, and one solution stands out above the rest: wire mesh cable trays.
