

DC device current busbar

Overview

Busbars are metallic strips, often made of copper or aluminum, that distribute power in high-current DC systems. When configured in parallel topologies, busbars can handle large currents efficiently while minimizing power losses and reducing thermal issues. At the heart of these systems are DC busbar topologies, which enable seamless integration of high-current devices in parallel configurations. These systems play a critical role in diverse applications, from renewable energy to electric vehicle (EV) charging infrastructure. In inverter systems, it replaces stacked battery terminals and ad-hoc cable branching. Amphenol's BarKlip® I/O products provide a convenient and customizable method of distributing high-current power between busbars, cables, and MSS International, through its specialist division G Corner Electrical Systems, designs and delivers robust DC busbar systems tailored for high-current industrial applications. MSS International's. Abstract—This paper presents a comprehensive analysis about bus bar design procedure.
