

How heavy is a one-meter-wide mesh cable tray

AI Overview

A one-meter-long steel mesh cable tray typically weighs between 5 and 15 kilograms, depending on wire gauge, mesh density, and material thickness.

Typical Weight Range The weight of a mesh cable tray depends primarily on material type, wire thickness, and tray design. For example, a 200mm-wide steel basket tray made from 4.5mm heavy gauge wire and 1 meter in length weighs approximately 5–6 kg . Scaling this to a 1-meter-wide tray (five times wider than 200mm) increases the material volume, so a rough estimate for a standard steel mesh tray of this width would be 10–15 kg per meter, depending on the exact wire gauge and mesh spacing .

Factors Affecting Weight

- Material:** Steel trays are heavier than aluminum or plastic trays due to higher density and strength .
- Wire Gauge:** Thicker wires increase both weight and load capacity. A 4–5mm wire is common for medium-duty trays.
- Mesh Density:** Smaller grid spacing increases the number of wires per meter, adding weight.
- Support Design:** Trays with reinforced side rails or additional crossbars weigh more.
- Corrosion Protection:** Coatings like electro-zinc or galvanization add a small amount of weight but improve durability .

Practical Considerations When planning installation, it is important to consider both the tray's self-weight and the cable load. Standard steel mesh trays can support 50–200 pounds per foot ($\approx 75\text{--}300$ kg per meter) depending on design and support spacing . Using closer support points reduces sagging and allows heavier cable loads without structural compromise. In summary, a 1-meter-wide steel mesh cable tray generally weighs 10–15 kg per meter, but the exact weight should be confirmed with the manufacturer or calculated using tray dimensions, wire gauge, and material density for precise engineering planning .
