

How many supports are typically used for cable trays

Overview

Cable tray support quantity can be calculated using a simple formula: $\text{Support Quantity} = \text{Total Length} \div \text{Support Spacing} + 1$. In a typical project, a 20-meter cable tray with 2-meter spacing requires 11 supports. When developing our cable support OBO can offer reliable solutions for systems, three attributes are at the routing and fastening cables securely core of what we do: efficiency, resilience and safety. For each of these installation challenges in the industrial environment. A rung spacing of 6 to 9 inches (150 to 230 mm) is preferable when the cable tray is used for instrumentation and control applications that require. The cable tray support span must be determined based on the manufacturer's load capacity chart and the total anticipated weight of the cables.
