

How to set up a router for fiber optic bridging

AI Overview

To set up a router for fiber optic bridging, enable bridge mode on your ONT/ONU and connect your personal router to it via Ethernet, allowing your router to handle all network functions.

Step 1: Gather Required Equipment

- Optical Network Terminal (ONT/ONU):** Provided by your ISP to convert fiber signals to Ethernet.
- Fiber-ready router:** Ensure it supports gigabit speeds or higher and has a WAN port or SFP/SFP+ slot.
- Fiber optic cable:** Typically SC/APC or SC/UPC connectors.
- Ethernet cable:** To connect the ONT/ONU to your router.

Step 2: Connect the Fiber Optic Cable

Locate the fiber wall outlet where the ISP fiber line enters your home. Plug the fiber optic cable into the ONT/ONU's optical port, handling the connector carefully to avoid dirt or damage. Power on the ONT/ONU and wait for the status lights to stabilize (usually 2-5 minutes).

Step 3: Enable Bridge Mode on the ONT/ONU

Connect a computer directly to the ONT/ONU via Ethernet. Open a web browser and enter the ONT/ONU's IP address to access its admin interface. Log in using the credentials provided by your ISP. Navigate to Network Settings, WAN, or Operation Mode and select Bridge Mode. Assign a specific LAN port (e.g., LAN1) for bridging if required. Save the settings and allow the ONT/ONU to reboot.

Step 4: Connect Your Router

Use an Ethernet cable to connect the router's WAN port to the designated LAN port on the ONT/ONU. Power on your router and wait for it to detect the internet connection. Configure the router using your ISP-provided credentials (often PPPoE) if necessary.

Step 5: Configure Router Settings

Disable the router's Wi-Fi if using a separate access point or mesh system. Enable Quality of Service (QoS) for VoIP or video streaming if needed. Verify that the router is handling DHCP, NAT, and firewall functions.

Tips and Troubleshooting

Some ISPs restrict access to bridge mode; contact technical support...
