

How to wire a card-insertion distribution box

AI Overview

Wiring a card-type distribution box involves connecting the main supply to protective devices, then distributing power to sub-circuits via MCBs and RCDs while ensuring proper grounding and safety.

Understanding the Distribution Box

A card-type distribution box, also known as a consumer unit or panel board, is designed to safely distribute electricity from the main supply to multiple sub-circuits in a building. It typically contains:

- Main switch or Double Pole MCB (DP MCB):** Acts as the main isolator.
- Residual Current Device (RCD):** Provides protection against earth faults.
- Single Pole MCBs (SP MCBs):** Protect individual sub-circuits such as lighting, sockets, or appliances.
- Neutral and Earth bars:** For connecting neutral and grounding wires ().

Step-by-Step Wiring Process

Turn Off Power: Ensure the main supply is disconnected before starting any wiring to prevent electric shock ().

Mount the Distribution Box: Secure the box on a wall in an accessible location, typically near the main entry point of the electrical supply ().

Connect the Main Supply: Use appropriately rated cables (e.g., 16mm² for a 60A single-phase supply) for phase and neutral wires (). Connect the phase wire to the main DP MCB and the neutral wire to the neutral bus bar. Connect the earth wire to the earth bus bar.

Install Protective Devices: Place the RCD (if used) after the main switch to protect downstream circuits. Install SP MCBs for each sub-circuit according to the load requirements (e.g., 10A for lighting, 16A for AC, 13A for sockets) ().

Connect Sub-Circuits: Pre-wire all sub-circuits (lighting, sockets, appliances) before connecting them to the MCBs. Connect the phase wire of each sub-circuit to the corresponding MCB. Connect the neutral wire to the neutral bus bar and the earth wire to the earth bus bar ().

Check Polarity and Tightness: Ensure all connections are secure and correctly polarized. Verify that the phase, neutral, and e...
