

The router's fiber optic cable turned blue

AI Overview

A solid blue light on your router's fiber optic port usually indicates that the connection is healthy and fully operational. What the Blue Light Means Many routers use color-coded LEDs to indicate connection status. According to standard router light guides, a solid blue light generally signifies that the fiber optic connection is active, stable, and transmitting data correctly, meaning no immediate action is required. This is common for BT routers in the UK, while other ISPs may use different colors for the same status.

Troubleshooting Considerations Even though a blue light usually indicates normal operation, it's important to ensure the connection remains reliable:

- Check the cable and connectors:** Inspect the fiber optic cable for sharp bends, kinks, or visible damage, as physical stress can degrade signal quality.
- Clean connectors:** Dust, oil, or fingerprints on the fiber connector can cause intermittent issues. Use a fiber inspection microscope or a one-click cleaner to maintain optimal signal quality.
- Power cycle the router or ONT:** Restarting the router or Optical Network Terminal can resolve temporary glitches or minor faults.
- Monitor for other LED indicators:** If the blue light is flashing or accompanied by red/orange lights, it may indicate startup, connectivity issues, or hardware faults.

When to Seek Help If the blue light changes to another color (e.g., red, orange, or blinking patterns) or if you experience slow speeds or intermittent connectivity, further troubleshooting is needed. This may involve testing signal strength with an optical power meter, checking transceivers, or contacting your ISP for support. In summary, a solid blue fiber optic light is a positive sign, indicating your router is connected and functioning properly, but regular inspection and proper handling of the fiber cable help maintain long-term network reliability.
